smart trash

Honest status: This is a portfolio/engineering prototype, not a proven municipal deployment. Demo records are synthetic, and no physical sensor calibration, production restore drill, live field pilot, or operational-savings claim has been validated. Review the release checklist before treating it as production software.

What is the novelty? A tested local improvement, not a globally new combination of sensors and AI. Where should sensors go? Evaluate selected hotspots and uncertain sites rather than assuming every bin deserves a sensor – maybe decide which bins stay with sensor after test period.

What counts as success? Balance service quality, crew time, routing, maintenance effort and cost.

What can be claimed on Sunday? A repeatable simulated comparison, clearly separated from evidence of real-world impact.
